

P3 HEALTH LAB

Research Page Design Guide

Structure the research page around five coherent programs, supported by real project photography and simple evidence-led copy.

Designer brief - academic, editorial, human, restrained

Use five programs as the backbone

Do not lead with a long list of pollutants, methods and outcomes

01

The Air We Breathe: Beyond PM2.5

APAM-Net · air microbiome · chemical-biological mixtures

02

Children, Schools & Personal Exposure

24-Hour Schoolchild · cleaner classrooms · routes to school · CLEAN RIDE

03

Climate, Wildfire & Environmental Resilience

BREATHE-East Africa · heat x air pollution · wildfire protection

04

Healthy & Equitable Mobility

MOVE-Africa · MOVE-Canada · Rwanda healthy mobility

05

Citizen Science & Environmental Justice

Making the Invisible Visible · ACB youth · SHARED SKIES

Recommended research-page template

Repeat one editorial pattern for all five programs

01 The Air We Breathe: Beyond PM2.5

Understanding the chemical and biological mixtures that shape what people actually breathe.

Research questions

- What does PM2.5 mass miss about chemical and biological composition?
- How do source mixtures vary across places and seasons?
- How can passive and low-cost monitoring expand exposure science?

Current projects

- Beyond PM2.5
- APAM-Net
- Canadian air microbiome
- Amazon air microbiome

Methods / places / selected outputs

Use short text links below each program. Do not turn methods into another grid of colourful “service” cards.

Visual system for the five programs

Real photography first; text and typography do the rest

Air / climate monitoring

Use real environmental monitoring locations.

Children / personal exposure

Use close human-scale research photography.

Mobility / exposure

Use field deployment images whenever possible.

Avoid: generated “science” illustrations, 3D molecules, neon maps, stock scientists

What belongs below the five programs

Keep domains, methods and outcomes secondary

Research domains

- Air pollution
- Built environment
- Chemical exposures
- Biological exposures
- Climate & environmental change
- One Health / global health

Methods

- Exposure assessment
- Mixture analysis
- Risk assessment
- Spatial statistics
- Epidemiology
- Citizen science

Health outcomes

- Respiratory health
- Cardiovascular disease
- Children's environmental health
- Asthma / lung cancer
- Infectious disease
- Microbiome
