

P3 HEALTH LAB — EXISTING REPOSITORY EDITING INSTRUCTIONS

GitHub repository:

<https://github.com/Shejaoli/P3-Health-Lab>

Project:

P3 Health Lab / HELTH Lab

Principal Investigator:

Dr. Egide Kalisa

Assistant Professor

Western University

Director, P3 Health Lab / HELTH Lab

1. MOST IMPORTANT RULE

THIS IS AN EXISTING WEBSITE.

You are an EDITOR/MAINTAINER of the existing codebase.

You are NOT being asked to create a new application.

DO NOT recreate the application.

DO NOT replace the project.

DO NOT create a new React app.

DO NOT create a new Vite app.

DO NOT migrate frameworks.

DO NOT redesign the architecture unnecessarily.

DO NOT deploy the website.

DO NOT publish/deploy to Replit.

DO NOT create a separate application.

DO NOT start a new database unless a later approved phase explicitly requires it.

DO NOT make unrelated changes.

Your job is to MODIFY THE EXISTING FILES in the repository.

Preserve the existing application structure and functionality unless the current approved phase specifically requires a change.

2. WORK PHASE-BY-PHASE

The entire project is divided into LARGE PHASES.

Examples:

PHASE 1 — Repository/code audit

PHASE 2 — Visual/design refinement

PHASE 3 — Homepage

PHASE 4 — Research

PHASE 5 — Projects

PHASE 6 — People/Team

PHASE 7 — Publications/Teaching/About

PHASE 8 — Join the Lab/News/Contact

PHASE 9 — Admin system

PHASE 10 — Final QA

Work ONLY on the phase I explicitly give you.

Do not automatically move to the next phase.

When I say:

“Continue Phase 2”

Continue Phase 2.

When I say:

“Start Phase 3”

Start Phase 3.

3. IMPORTANT: DO NOT OVER-DIVIDE

I do NOT want you to turn every tiny coding action into a separate user-facing step.

Work internally however you need, but report and organize your work by PHASE.

A phase can contain several related edits.

Example:

PHASE 2 — VISUAL REFINEMENT

You may inspect and modify:

- App.tsx
- index.css
- relevant existing components

Within that phase.

Do not stop after changing one CSS property and ask me what to do next.

Complete the approved phase carefully, then stop.

If a phase is genuinely too large to safely complete in one context, split it into clearly named subparts such as:

Phase 2A

Phase 2B

Phase 2C

But do this only when necessary.

4. FIRST ACTION

Before making any code changes:

Inspect the existing repository.

Determine:

- current project structure
- package manager
- framework
- frontend structure
- current routes
- current components
- current CSS/design system
- backend status
- database status
- authentication status
- existing assets
- current App.tsx structure
- whether previous design changes already exist

DO NOT MODIFY FILES during the initial audit.

Then give me a concise report.

Wait for my phase instruction.

5. EXISTING CODE IS THE SOURCE OF TRUTH

Never assume that another AI completed a previous task.

Inspect the actual current files.

If a requested change already exists:

- do not recreate it
- preserve it
- report that it is already present

If a previous AI partially changed something:

- inspect the current state
- preserve correct work
- fix only what is necessary for the approved phase

6. CURRENT WEBSITE DIRECTION

This is an academic research laboratory website, not a commercial/startup website.

The desired visual direction is:

- academic

- calm
- professional
- restrained
- spacious
- readable
- accessible

Prefer:

White/off-white

Charcoal/dark neutral

One muted accent

Reduce:

- excessive colors
- gradients
- glowing effects
- glassmorphism
- excessive shadows
- excessive rounded cards
- decorative graphics
- AI-template effects
- excessive animation
- marketing slogans
- oversized CTA buttons

Use whitespace and typography as major design elements.

7. HOMEPAGE DIRECTION

The homepage should clearly establish:

Dr. Egide Kalisa

Assistant Professor

Western University

Director, P3 Health Lab / HELTH Lab

Include a concise research statement.

Avoid marketing language such as:

“Find your way in.”

Reduce/remove oversized “Collaborate” treatment.

Eventually include:

- Research Areas
- Featured Projects
- Selected Publications
- small Team section
- Global Research Map where relevant

- latest 3 News items
- Join the Lab
- subtle partners/funders

The People–Place–Planet visual should not dominate the hero.

8. RESEARCH

Research themes may include:

- Air Pollution & Exposure Science
- Climate Change, Wildfires & Heat
- Children’s Environmental Health
- Environmental Justice
- One Health, Bioaerosols & AMR
- Sustainable Transport & Cities

Use concise academic descriptions.

Avoid commercial language such as:

“services”

“solutions”

9. PEOPLE / TEAM

Use professional, consistent presentation.

Categories include:

- Principal Investigator
- Postdoctoral Fellows
- PhD Students
- MSc Students
- Research Staff
- Undergraduate Researchers
- Visiting Scholars
- Alumni

Do not invent missing information.

Use “TBD” or leave information empty when necessary.

Do not invent:

- publications
- research projects
- awards
- universities
- degrees
- positions
- research findings
- dates

- funding
- collaborators

10. PUBLICATIONS

Do not fabricate publications.

Where appropriate, publications can link directly to verified external academic profiles.

Google Scholar

ORCID

Western University profile

CV PDF

External links must be real.

11. ADMIN SYSTEM

A secure admin system is a FUTURE PHASE.

Eventually it should allow authorized administrators to manage:

- people
- photos
- projects

- publications
- news
- research areas
- opportunities
- map locations
- partners/funders

It should eventually support:

Create

Edit

Delete

Upload

Replace

Publish/unpublish

However:

DO NOT BUILD THE ADMIN SYSTEM NOW unless the current phase explicitly asks for it.

When that phase arrives, authentication and authorization must be implemented securely on the server.

Hiding an admin link is NOT sufficient security.

Modify the smallest number of existing files necessary.

Do not create new files unless they are genuinely required.

Do not reorganize the entire repository unnecessarily.

Do not rewrite App.tsx simply because it is large.

If refactoring becomes necessary, do it carefully and preserve behavior.

13. NO DEPLOYMENT

This workflow is ONLY for code editing.

DO NOT:

- deploy
- publish
- connect deployment
- overwrite production
- change hosting
- start production services
- make production database changes

I will handle GitHub/deployment separately.

14. TESTING

After completing an approved phase, perform only appropriate local validation.

For example:

- TypeScript check
- existing tests
- build check if useful

But do not turn this into a deployment operation.

Never claim something passed unless it actually passed.

If validation cannot run, say:

“Validation not run — [short reason].”

15. GIT

Do not reset Git.

Do not force push.

Do not rewrite history.

Do not commit unrelated files.

If Git operations are available and I explicitly ask you to commit, first inspect:

Git status

Git diff

Then commit only the intended changes.

Otherwise, simply modify the files and report the changed files.

16. PHASE COMPLETION REPORT

At the end of each approved phase, report briefly:

PHASE:

Phase X

STATUS:

Completed / Partially completed / Blocked

FILES CHANGED:

- path

- path

WHAT CHANGED:

- short bullet
- short bullet
- short bullet

VALIDATION:

- TypeScript: PASS/FAIL/NOT RUN
- Tests: PASS/FAIL/NOT RUN

NOTES:

Only important issues.

NEXT:

State the next phase, but DO NOT start it.

STOP after the report.

17. IMPORTANT BEHAVIOR

Focus on the code, not long explanations.

If you need clarification, ask a short question.

Do not give long tutorials unless I ask.

Do not repeatedly explain the same architecture.

Do not make assumptions when the repository can be inspected.

Do not fabricate content.

Do not make unrelated improvements.

Do not change functionality merely for aesthetic reasons.

18. FIRST TASK

Start with ONLY:

PHASE 1 — EXISTING REPOSITORY AUDIT.

Inspect the actual repository and report:

1. Current project structure
2. Current frontend architecture
3. Current backend status
4. Current database status
5. Current routes/pages
6. Current content/data structure
7. Current assets
8. Current design system
9. Existing admin/authentication status

10. Which previous visual changes are already present

11. Important risks

12. Recommended phase sequence

DO NOT MODIFY ANY FILE DURING THIS INITIAL AUDIT.

After the audit, STOP and wait for my instruction.

FINAL RULE

REMEMBER:

EDIT THE EXISTING APPLICATION.

DO NOT CREATE A NEW APPLICATION.

DO NOT DEPLOY.

DO NOT REBUILD THE PROJECT.

DO NOT MAKE UNREQUESTED CHANGES.

WORK PHASE-BY-PHASE.

PRESERVE EXISTING STRUCTURE AND FUNCTIONALITY.

INSPECT BEFORE EDITING.

VERIFY BEFORE ASSUMING.

KEEP REPORTS SHORT.

WAIT FOR MY NEXT PHASE.
